## Energikonsept

Strøm

Skråveggen vender rett mot syd med 33 graders vinkel, og har således optimal vinkel for å høste energi med solceller. Energiforbruket dekkes av egen energiproduksjon. Solcellepanelene forsyner bygget med nok solenergi til å nå Powerhouse-ambisjonen.

Termisk masse

Skråveggen samt dekkene sørger for termisk masse. Termisk masse lagrer varme / kulde og jevner ut temperatursvingningene i bygget.

Varme /kjøling

Energibrønner boret i fjell forsyner bygget med frikjøling om sommeren, og fungerer som energikilde for byggets varmepumpeanlegg om vinteren

Luft

Ventilasjonssystemet er basert på en hybridmodell med naturlig - og fortrenningsventilasjon. Tilluft distribueres fra teknisk rom via skråveggen, og om sommeren sørger skråveggen for naturlig oppdrift av avkastluft. Vinterstid gjenvinnes varmen fra avkastluften. Vinduer i fasadene åpnes automatisk ved behov (window master).

Ability to change the building industry
